

**Neugart N-series servo-gear-heads are offered
in two different output configurations.**

There are tens of thousands Neugart “PL” and “PLS” type high precision gearboxes in operation worldwide. When Neugart introduced this gearbox line over 20 years ago, the gearbox output flanges were modeled after the square IEC frame servo motors.

Although a true output flange standard has never been formalized, over the years the extended pilot configuration has become the most commonly used.

Designing our newest N series high precision gearbox line, which is replacing the PL and PLS series, we decided to make both flange versions available; the extended pilot output flange as well as the classic Neugart style.

Customers currently using the PLS units can continue to use the classic Neugart style output, whereas if customers prefer to use the extended pilot version they have the choice.

The Neugart PLN series nomenclature calls for an “OP14 Option” if the Classic Neugart flange is requested; if no option is specified the PLN unit with the long pilot flange will be supplied. There is no price difference between the two offerings.
